Why a TV instead of a monitor? Just curious.

What you should do, is just SLI that GTX 460 with another one.

I think I recall telling you about the 'SLI Patch' that you can use on AMD chipsets. The installation process is easy, and I've yet to have issues on my 790FX board with two GTX470's.

Why not pick up a cheap or used GTX460, and implement the patch? You'll get gaming performance comparable to the 6950, and you can run multiple-monitors for both gaming, and productivity.
