Brandan wrote on Tue, 10 April 2012 09:26It also depends on the ISP. If you ban the first 2 numbers you usually ban the whole ISP of a large portion of it. My ISPs dynamic ip changes the whole thing completely oddly enough if you disconnect your router for an hour. For the DNS i use openDNS that's not my ISPs default DNS. That's also not the DNS server you're looking at that's the hostmask the server puts on it to help identify the client DNS server resolves names to numbers

Example google.com -> 255.255.255.255:80

If every one of the 7 things I've said failed you could always steal your neighbors Internet or crack the WEP encryption using Linux since WEP is easily broken.

LOL DNS does port numbers now. Sweet. And using your neighbor's internet connection over WiFi doesn't help much if he's on the same ISP as you.

I find it easier to not cheat and therefore not get banned from shit.
