The problem with SSDs is that lots of random writes going on can seriously bog down the controller, sometimes resulting in atrocious read times worse than those on a HDD. The more expensive drives tend to cope better but if you're having problems your best bet is to shut down any and all programs that could be trying to write to the disk for any reason at all.

Incidentally, if you are playing on a server for which you have not previously downloaded the maps then Renegade itself will be constantly writing to the disk as it downloads maps in the background.
