That's probably the result of the glacial erosion, huge chunks of rock carried in the glacier will rip up more of the surface as it *slowly* gets dragged along by the ice. It's the same reason places like Scotland are so craggy, since it was once under a glacier.

Must depend on size and number of passes of the glacier, get one big one doing it all and you end up looking like Bismark, North Dakota.

And don't fool yourself, those aren't hills in the background, just shelter belts.
