I've tried everything I can think of to get it to work from setting the .w3d to open with the program, click and drag to the program (both open .w3d view and closed), put the .w3d file into the w3d view folder (tried several files), and even removed the asset report from the folder.

If it's something simple then what am I missing and if not then what haven't I done? Is there some command line commands I have to use?
