TheGunrunDo you believe that there are more than one you? Do you believe we ever come to an age in our human history where we are able to open a worm hole through time and space?

Belief in a parallel universe is purely a faith matter. Contrary to popular belief, a parallel universe is not required by General Relativity. I think all that it suggests is that beyond an event horizon, things would appear to be going backwards on the other side because of the light that had been captured by the black/white hole would be revealed in reverse order. Correct me if I'm wrong, but I think that backwards time travel would require a hypothetical "negative energy," which doesn't exist.

You can't dismiss it as much more than guesswork.
