well , that was a point that i had already covered and thats is why i said that the "worm hole " would have to be the way to go, as far as space travel.

ok, so far from what i have found out about these types Lorentzian wormholes, is that they are made up of "exotic matter" stuff that is repelled by gravity, rather than attracted by it. this exotic matter has less energy than a pure vacuum.

what i was reading also went on to say that time-dependent wormholes actually have two throats, one for each direction of traffic. witch would make it possable for the time traveler to return form where he came, by using the same worm hole.

now even if this types of worm hole could be used for travel so would still have to get to them first , right ?

Quote:wessxdog: "You don't "make" wormholes. They already exist"

well, there were also talking about making them too. the problem is finding enough of the "exotic matter" to do it . but hey, there working on it atleast. that should give us some hope .
