BearxorEnglandBearxorIf it's over 55C its worth worrying about.

My AMD 2000 averages 50 - 60c and ive never had a problem or a reboot like that.

Different processors can handle different temps, even ones of the same speed, core and batch.

I have a 1.1 T-Bird AVHA that will refuse to run at any temps above 47. I have another AVHA 1.1 that will run all day long @ 53.

In my experience normal operating temps should not exceed 60.

Honestly, don't you think yours is running a bit hot? A Palomino, maybe not too much, but if its a Tbred then you're way out of range. Even on stock cooling I can get 2000+ TBred down to around 43 idle and 49 load.

Maybe you have too much AS3 on it?

My Athlon 2100 XP hits 60C sometimes, it once went up to 68C until I removed the thick layer of dust from the heat sink. Even at that temperature, I experienced no problems.
