---

When I ran the 'RENEGADE PERFORMANCE ANALYZER', it seems that my laptop is 1162% better than the minimum requirements.

As you can see I have a P4 1.6GHz, 256MB RAM, and a crappy S3 Savage/MX video card. Also I have DirectX9 installed.

When ever I try to install Renegade, it shows the small clip in the beginning, up to the point where it shows all the HUD. After that, the screen goes back to my desktop. Could it be the video card that isn't allowing me to install it? If so, then how come the analyzer says I can?
