You can run your memory at lower speeds with no problem. They may even be more stable at th lower speed then marked. I recently put a PC 2700 DIMM in a 266Mhz motherboard as the PC2700 DIMMS were cheaper than the PC2100 ones.

PC2100 (266Mhz)

PC2700 (333Mhz)

PC3200 (400Mhz)

PC3700 (466Mhz)

Genrally your motherboard will support up to 2 GB of RAM. If you have an AMDAthlon XP chip then the motherboard isn't likely to be limited to 1 GB.
