hi, i got a problem...

i created my map terrain and merged it with the bases and for each base a conyard. well, it went wrong, i couldn't export it as a terrian because there where duplicated bones in it. I deleted both conyards and merged them again, each time i got an error about the duplicating, i changed the name by adding a a, b or c at the end. So all went fine, no duplicated names in the list. But as soon as i export it as a terrain, i get the error message that MNCON_LT~003 is a duplicated name of the bone. So i opened my list, but there's no MNCON_LT~003 in it, could someone help me out?
