PlanetCNC.comProblems with the Voodoo cards

Unfortunately, not much can be done about the problems with the Voodoo cards, as these cards have no valid DirectX 8 supported drivers. You can try using a 3rd party driver (in fact, some drivers such as Goat and X-3DFX have been reported to fix the problem) but they don't work every time.

Note: Some people have reported success in fixing the wall glitching problem on Voodoo cards by setting the texture value to 32-bit in the Video menu of the Renegade Configuration utility.

If you're still having problems, you might also want to try to (while in game) switch out of the game by using ALT+TAB then switch back in. This has solved the problem for some users. [back to top]
