I have been hearing some rumours and I am still unclear on some features/abilities of RenGuard.

#1: Will the Server Side Client made by Dante be released?
#2(goes with #1): If not, how will BR .Net/IRC scripts be able to utilize RenGuard?
#3: I hear the only way for a server to use RG is to use BRenBot, how true is that?
#4: I hear RG will have the ability to crash FDS's and other things like modify the Scripts.dll files etc. on the servers, how true is that?
#5: I need a definitive reply to this one, will or will RG not block in-game command abuse?
#6: It appears RG will have some other features like mass-hostmsgs, what is that feature for?/Will it be abused?
