---

I have a wireless router and I usually get a ping of about 30-90 for online PC games(like BF V and RTCW ET UNREL2k4 SOF2 ect.) Now I was wondering, if I bought a network adapter(for PS2), could I just hook the ethernet cord into the back of the router directly to the network adapter and have it work with no problems, or would it be a better bet to just unplug the router for the time being and just run it directly to the cable modem?

Also, about how much would 30 feet of ethernet cost?

Thanks
