RenGuard is under active development which means we will continue to update and address all problems. We did pretty extensive beta testing but as with ALL software, other bugs come out once 1000+ people start using it, fortunately usually only affecting a few people with nonstandard hardware, operating systems etc.

With that in mind, please post all the info you can about your system, and exactly what errors you get. Screenshots are good too. Please try the newest RG client first.
