RexBTW now that I'm thinking about it, my FPS also dropped.... but it was always for a 1-2 sec. drop to like fps 15 and then it jumps back to 60. This event just happens on random times when I'm ingame... Also when I'm just idling ingame.... (Other programs are shut down like my antivirus firewall or whatever)

Like I asked before: Can more memory (RAM) be a good solution?
I think it's what Alkaline described.

It happens during game because RG scans periodically during the game.
