Inside the shell are the two components that produce Sarin. When it is fired from a howitzer the two start to mix. Then when the projectile explodes it vaporizes the liquid in to the gas stage. Read the fucking articles and learn. I was in the Army for 8 years and I am also a veteran of the first Persian Gulf War. Some of the first things you learned were the types of WMD's you may encounter and their ways of dispersion.

One of the main reasons only 12 Japanese subway goers died and not more is because they relied on natural evaporation to take effect.
