Terminator, you could always try using something like riva tuner to clock your card up a bit. What card do you have?

Remember the basic stuff like not syncing every frame, keeping the core graphics settings on low, low game resolution, medium settings etc. If surface effects are set to 2, this can impact your game. I found mine performed better at the middle.

Remember, the auto config for detail settings isn't always right. Why? It doesn't take into account the other features of your CPU, just your graphics card max power. Mine tries to set everything at max including multi-texture lightmapping and trilinear filtering. But at that, I get lower performance. I Can tell you right now a radeon 9200 SE won't perform well on max settings in something above a 10 player game. Best set everything to the second highest and change to vertex and bilinear filtering.
