He is right, I know it. VTOL Mammoth, you could just make a copy of the Orca and give it a picture af a Mammoth, but the turrets may be messud up, either way, they will be.

I think it is pretty simple to do. Click the Mammoth under GDI Vehicles on the right bar. Then click the MOD button. Then go to... Not sure what tab. Probly the "Physics" Tab. THen at the top it should say "Tracked Vehicle" In a drop down box. Change it to VTOL and export your map like normal. I think. I haven't tested my Ultra MLRS yet. (Yah! 900 Armor Baby!)

Haven't looked much into properties of the different stuff yet, but I've run into the opposite problem. I made a Recon Bike for GDI, basically identical to Nod, however I think I have the weight or some setting like that messed up caused it goes way up into the sky. I haven't looked into the cause of the problem, but I believe there is some kind of object weight setting. Maybe it has something to do with itthe flying Mammoth, too heavy?[April 21, 2002: Message edited by: BuBaJones]
