It's still being worked on, but it does presently work in-game.

It costs \$2,400. Once you fire by pressing the mouse button, it will kick you out of the vehicle. Its harmonic resonation engine begins to work, and the piston at the rear starts charging it for detonation.

After about 15-20 seconds, it detonates.

The blast wave will look different in-game. It will appear to be more like a wall of air, a shockwave, with dirt mixed into it.

[View Forum Message](#) <> [Reply to Message](#)

ACK, did you get this idea from Dark Reign?

I remember that these type of vehicles were in that game. They were funky, but shockwaves travelled differently but it is a very nice implementation of it

Good work, I'm sure you will get it to work just how you want it to in time.

Tilly

Ever tried reading what he said before posting something?

Quote:The blast wave will look different in-game. It will appear to be more like a wall of air, a shockwave, with dirt mixed into it.

It's just a trailer of the final version, it will be diferent, so don't take it as it was already final.

And by the way, since when did they say that it was a COPY of Red Alert? If it'd be a copy, we'd

be playing in RTS mode right now, no?

DethHav0cObviously theres a severe FPS drop when the shockwave happens... Otherwise he wouldn't have turned it off O_o

I'll admit that shockwave isn't optimized yet, since I only worked on it for 20 minutes. I get a 5-10 FPS drop when it detonates. However, there's a more important reason why someone wouldn't show their FPS when taking a rapid succession of screen shots. Doing that can bring your FPS to 0 even if you are standing in a corner, looking at the wall.

I turn my FPS counter off when taking images like this because my FX 5200 hates emitters or alpha textures, so when it sees enough of them, it loses a lot of performance.

It's a low level card. Even one step above it, a GeForce 4 Ti 4200, can keep perfect FPS in-game when those emitters are playing.

Renardin6Nice effect... I don't remember a such graphic aspect on Red Alert... So it's a mod based on Red Alert. Not a Red Alert copy.

You should stop and think about what you're posting before you hit the submit button. Of course this effect wasn't in Red Alert, it's an 7-8 year old 2d game. (Btw, if you'd actually play Red Alert you'd notice that the MAD tank effect is very similiary to this effect.)

OMG! RenAlert is including 3d models, but red alert wasn't 3d!!1

AircraftkillerI turn my FPS counter off when taking images like this because my FX 5200 hates emitters or alpha textures, so when it sees enough of them, it loses a lot of performance.

It's a low level card. Even one step above it, a GeForce 4 Ti 4200, can keep perfect FPS in-game when those emitters are playing.

The Geforce FX 5600XT 256mb is at about \$110 right now, and it doesn't seem to have any issues with emitters or alpha textures, even when Renegade is at 1024x768 resolution. If you ever want to replace your card and not pay so much money, I suggest you try the one I have.

To everyone who seems to not like how the beam will severely drop your FPS, don't be so upright about it, of course it will for everyone. They can't make it do any better, so why are you complaining?

NeoXDells suck regardless of what you put in them. You should have got custom job or built it yourself. AND if your rich Alienware is the only brand name computer i would ever buy.

If you are going to buy a pre-built computer, Dell is the best you can get. It's almost as cheap as building it yourself, you get great deals/upgrades AND a warranty. You don't get that with building it yourself. There is absolutely no difference in performance or speed with a Dell than a home-built computer other than the obvious upgrades, all of which can be done to the Dell as well. And if you think Alienware is the only way to go... right.

Renardin6FX 5600 and Ti 4200 are similar on performance.

Fx5200 is far behind Ti 4200.

Wrong. The FX 5600 beats the Ti4200 by far. I've tested this before; I have two friends who have the Ti4200 and mine out performs theirs by far. Also, the FX 5600 is noticeably better than the Ti4800SE. Whoever has the FX 5600 and thinks it's shit probably has the 64-bit version. A lot of resellers trick people into buying the 64-bit version of the FX 5600, and that one is the one that sucks. How I know? Because I was tricked also, but I sent it back because they gave out false information that it was the 128-bit version. The 64-bit version is the equivalent of the FX 5200, maybe even worse.
