After installing BRenBot and WOLSpy, RenStat kept getting errors, so I was going to build my own stats program, but then I noticed a change in the results##.txt files format.

Beofre/normal:

<http://www.ozclan.com/results11.txt>

After:

<http://www.ozclan.com/results12.txt>

Is this the results file bug? Or this something different?

Well, this fix turns out to be very easy, if youre designing your own Renegade Stats system. In the file with the bug, the only field that is not a static size is Player. Find the length of the string, minus the length of the static fields and you get the length of the Player.  
`varLenght = Len(strSring) - 59`

```
strPlayer = Trim((Mid(strSring, 6, varLenght)))
```

Edit: WOL and GSA modes output different file formats, but this method will work for formated files or the "bug" file formats.
