I just installed an nforce2 epox motherboard (model 8RDA3+) and I have no sound. The drivers are installed and everything but the system doesn't recognize my headphones. Is this some hardware issue? I can't seem to find anything about it anywhere...

Are your headphones plugged directly into your card? You might want to mess with the volume control options in the control panel.

EDIT #2: nevermind, for some stupid reason the audio was disabled by default in the BIOS.

Yeah I kicked it once and it seemed to raise the sound quality a little bit. Then I tried smashing the motherboard with a hammer and now I'm listening to top-quality sound.

First step: Restart (If that doesnt work)
Second step: Kick the tower (If that doesnt work)
Third step: Beat the Mother Board with a hammer (If that doesnt work)
Forth step: Open is up and piss in it (If that doesnt work)
Fifth step: Call tech support

Buy a new sound card. Onboard sucks, you gotta admit that.
