Does anyone know how much bandwidth a TeamSpeak server can take up with 10 people on everyday for a whole day (hypothetically)

Your cable internet connection is to slow to handle it. Everyone will lag like a dirty old man trying to cross the street on a green light.

rolls eyes

I just want one for my friends and me, they live not far away on the same ISP, so it doesn't go that badly, I just need to know the bandwidth usage. FYI, most the server goes pretty fast most of the time.

Running all that at once and it doesn't really matter where your friends live it will lag your internet connection, and with you running so many open ports on your home computer you are asking to get hacked you really should consider installing a firewall on the server you are running.

50 gig? What isp have you got? Mine apparently complains after 2, but then I don't have a fast enough connection to reach it.

Incidentally does the bandwidth needed depend upon sound quality and screen resolution? I've tried both and it doesn't appear to stop any lag..

50 gigs? Imao your lucky you dont live here

my line is being upgraded for free from 512 to 2MB with a 15GB cap!
half as much twice as fast!

My school has one of the best connections I have ever seen, 10 download, 4 upload. Too bad the

computers are so slow it doesn't matter what the connection is.

TS uses next to nothing.

My clan's TS has an average of 3-6 people on it all the time. It has been up 10 days now and only sent out 243 MB of data.

If you are hosting for a few friends it'll be fine. I hosted one for some people I knew a while back on my retarded DSL connection, and it's fine. Lag won't be a factor.
