I have been working on the new look and color schemes for rengen.com and have finally finished. I have not yet finished the download section though, the downloads do not exist. But its redone, organized and simple. I made it all from scratch with a few cut and pastings for the RenGen logo. I hope everyone likes this new layout as i do.

Check it out here:

rengen.20fr.com

HTML Questions:

- 1) How do you insert images into a textbox area?
- 2) How do you change font settings in a textbox area?
- 3) How do you change the scroll bar color of the main window bars?

deadfive-

Lookin' better man! Lot better than what I could do. Your RenGen banner is still pixelated - Remember to never utilize a small image & make it bigger on your page. That's what messes it up - start big & then shrink it to fit your page.

-Pat

[View Forum Message](#) <> [Reply to Message](#)

I'm sorry, but that doesnt look finished to me. The text on the side comes off the edge, the Banner

at the top saying "RenGen" looks resized in Paint (in other words, looks too pixelated, maybe you could make the banner look better with a normal sized logo, and some pretty pictures).

The site is BEST viewed on a 1024x768 resolution because that was what it was made on. 1024x768 is one of the most common resolutions used. Id rather use codes such as <td width="100" height="100" than using a code such as <td width="100%" height="100%" because it is a pain to work with. (Or i just havnt figured it out yet)

Question: Could anybody find or give me a picture of the Renegade name that is really big, that way i can shrink it down so my rengen logo is not pixlated.

Your website still makes me want to spew.

It looks totally unfinished.

Try creating a background in photoshop then slicing it. You'd be suprised at how much better your website owuld look.

Web sites built purely in HTML dont look pretty, at all.

I don't know what more you could possibly expect. It is a nice clean layout, one color scheme, and a cool logo, that is a little pixelated. (which I will fix).

Maybe if I had some support and some ideas from other people instead of people dogging my site, then I could possibly make it worth while to see in your eyes.

Give me some ideas, not bad comments. I never said you would like it either, but most people I have talked to seem to have liked it.

But, like I said, give me some ideas, not bad comments.

[View Forum Message](#) <> [Reply to Message](#)

Just because your site is "best viewed" in 1024 x 768 doesn't mean that's the only resolution it should work in.

It does look better than the first one, but I can STILL make one in pure HTML that easily confines to any resolution, and looks a hell of a lot better than that does.

Web design is not for you, please, leave it to the people who know what they're doing.

OK dead - Let's say you have 10 dollars worth of a image size & you reduce it to 20% of that, then

you have 20 dollars worth of an image.
Or 20% of a 100x100pixel image will be 20x20pixels etc. It's that simple.

So if I have a 100x100 pixle image, and the code is `<td width="100" height="100" background src="blah.gif">` How would that be?

Would it be `<td width="100%" height="100% background src="blah.gif">` and still be the same size as it was in the first code?

Or are the codes I just typed wrong?

Subject: Last question, please help
Posted by [genetix](#) on Tue, 22 Mar 2005 03:31:15 GMT
[View Forum Message](#) <> [Reply to Message](#)

kind of. Remember that the TD size is not your image size. That changes the size of the table. When your creating a website like that try to create images for 800X600 monitors(still VERY common). Then with your tables if someone is using a different sized monitor it will just reformat the image to fit their screen.

Please tell me you know how to work out percentages though. Like if your menu bar is %20 then your sites main content must be %80.

Subject: Last question, please help
Posted by [Jzinsky](#) on Tue, 22 Mar 2005 03:36:35 GMT
[View Forum Message](#) <> [Reply to Message](#)

No, 100% would be the full screen, it would resize according to resolution. there is no definite formula to work it out. You should also use more than one browser too, and more than one pc if possible to make sure it works on all kinds of machines.

Some program like Dreamweaver or Frontpage (if that's what the thing is) would help too, and if you want to learn the code, just display it and see what everything does.

Furthermore a tutorial book would work wonders. I have some and could make pretty much anything anyone wants me to make, but I'm not artistic in the slightest.. ergo no site for me..

If you had a 100 pixel wide picture on a 1000 pixel wide screen, then to keep it the same size you would need to size it at 10%, yes?

Subject: Last question, please help

Posted by [Dave Anderson](#) on Tue, 22 Mar 2005 03:39:14 GMT

[View Forum Message](#) <> [Reply to Message](#)

My webpage contains no percentages, thats why i need to know about them.

On my webpage, for example, i have a table that is the exact height and width of its background image. then i just centered it inside a bigger table.

What i need to know is this:

Say i have one table at 100%, so it takes up my whole screen. That is where i will put all the stuff of the website in. Then say i add another table centered in the big table, and this table is at 50%. Will this take up 50% or half the space of the big table?

I have 6 tables on my main page, one is for the whole screen, the other two for side menus on the right and left, and the two menus with my logo at the top and bottom, and the llast one is in the middle where the text area is.

So how would i divvy up the percentages for the whole page?

Subject: Last question, please help

Posted by [genetix](#) on Tue, 22 Mar 2005 03:39:18 GMT

[View Forum Message](#) <> [Reply to Message](#)

JzinskyYou should also use more than one browser too, and more than one pc if possible to make sure it works on all kinds of machines.

Thats a total waste of time. Spend the time now to save the time later. Code all your HTML to W3 standards. That way almost any web browser will work flawlessly with your website.

It also makes your code easier to ready and more compatible with changing technology.

So how would i divvy up the percentages for the whole page?

You have to slice up the whole website into percentages. I would suggest drawing your whole website out on a piece of paper and estimating the percentages. When your done add all the wdths together and make sure they equal 100. Do the same with the height. Then write the HTML. Once that first "draft" is done look at the site and slowly make changes. If you make one box bigger you have to make another smaller. Your total always has to equal 100.

[View Forum Message](#) <> [Reply to Message](#)

Why only 50% height? How the hell wouldn't it? If you think about it, it makes perfect sense that it's 50%. Think about it this way:

say you have a table of 4x4:

....
....
....
....

Now, you make the first cell, 50% x 50%, it'll look:

Code:

```
<tr>  
<td height="50%" width="50%"></td>  
</tr>
```

Example:

....
....
....
....

now 2 cells of 50% x 50%:

Code:

```
<tr>  
<td height="50%" width="50%"></td>  
<td height="50%" width="50%"></td>  
</tr>
```

Example:

....
....
....
....

If your code looked like this:

```
<tr>  
<td width="50%" height="50%"></td>  
</tr>  
<tr>  
<td width="50%" height="50%"></td>  
</tr>
```

That'll look like:

....
....
....
....

I still have troubles with the percents, and yes i know math good.

I'll have a code like this:

```
<td valign="top" align="center" width="100%" height="100%">
```

*That is the table where everything will go inside. But the table is the right width but is completely flat!

Then i make a new table:

```
<td valign="top" align="center" width="100%" height="50%">
```

But the table is completly flat!

The height percentages dont work!

plz help

Subject: Last question, please help

Posted by [cheesesoda](#) on Tue, 22 Mar 2005 21:54:52 GMT

[View Forum Message](#) <> [Reply to Message](#)

you need a row (<tr>) tag, and a cell (<td>) tag before the tables that are inside of the main table.

Example(s):

<http://www.thekingsthroner.net>

<http://www.digitaldepiction.net>

[View Forum Message](#) <> [Reply to Message](#)

I learned css, its freeking awesome. I got the percents to work, its awesome.

Is there a way to make your own table designs and borders?

Like par say, if i want a table with a border that looks like a transparent tube all the way around it?

Also, i have a table with a code like this:

```
<td width=60% height="50% valign="middle" align="center">
```

blah.gif ill use the image code, this is a background i made from a winplayer skin that has borders and a open box in the middle for a textbox.

but then ill put a textarea in the same table as the image but its below the image, and i want it to fit in the box of the image.

And how do i position the textarea in the box, using percents, so its always in that spot no matter what size the ie window is or the resolution?

i tried using a <div position absolute but its moves when you have bigger or smaller esolution or when you maximise the window. Please help.

Subject: Last question, please help
Posted by [cheesesoda](#) on Wed, 23 Mar 2005 17:46:49 GMT
[View Forum Message](#) <> [Reply to Message](#)

You missed 1 (or 3) quotation marks. Your retarded self forgot to add a quotation mark around the 50%, and it'd probably be best if you had quotations around the 60%, but not needed.

As for the position absolute: duh it's going to move per resolution. The absolute position means that it will be at the same point whether or not the resolution changes.

Example:

A point at (2, 2) on a 4 x 4 grid

....
....
....
....

Now the same point (2, 2) on a 8 x 8 grid.

.....
.....
.....
.....
.....
.....
.....
.....

See, instead of the point staying near the middle as in the first example, it ended up being towards the top left hand corner on the second example.

[View Forum Message](#) <> [Reply to Message](#)

its just so much easier to learn Shop and Dreamweaver than to Hand code it all yourself....

Subject: Last question, please help
Posted by [Dave Anderson](#) on Wed, 23 Mar 2005 19:06:53 GMT
[View Forum Message](#) <> [Reply to Message](#)

That was my example, i do have quotations around the percents. But the problem is that i cant get the table background to stay in the same spot no matter what. When you maximise the window it moves to the left and shows part of a copy of it on the right. the textarea stays in the same spot but the table background moves around.

here is that part of my code:

```
<td valign="middle" align="center" background="Textbox.jpg">
```

```
<textarea>blah blah blah</textarea>
```

but the table background moves around.

gbull, im using a program called HTML builder.
