I am trying to get my FDS to run on wol (i have 3/4 serials with correct user names and pwds) but the fds replies to me with "Invalid serial". I test the serial on my home machine and it works no problem.

This problem happens with every serial i've tried.. any ideas?

Also, how can i get access to the server owners forum?

PM Crimson asking for access to the server owner's forums. Tell her what server you own or are admin of.

There is a difference between an FDS serial and a game serial. By the sounds of it you were using game serials.

If it says those serials are invaled then they are, keep asking around.

No they are FDS serials im not a complete moron

It just seems to run fine on my pc and is able to connect and be connected to, but as soon as i try with the exact same serial and login and pass on my dedi server it no longer works and gives me the invalid serial error.
