Well recently my brother was going to get upgrades for his computer, but they ended up telling him it would be cheaper to buy a whole new one since he wanted top of the line. His old one had a defective motherboard which was replaced, and i got hold of his old computer. In my opinion his old one couldn't really get much better, but he thought it was worth it so he could play doom 3 and far cry on max detail etc.

So i replaced my old computer with his old one, and now ive got a huge upgrade compared to my old sony vaio that was bought in 2001.

I was dealing with 7-10 fps on a 32-50 person server on renegade with my old computer, so this is a huge increase for me since i was playing half life 2 on maximum detail with no frame drops.

I dont know much about computer stats, this is a custom built computer though that he got just a year and a half ago.

well its Amd athlon(tm) Xp 1900 whatever that is lol.

1.60Ghz , 768mb of ram, and geforce 4400 TI i believe.

Plus it will be upgraded to 1 gig of ram this following week or the next.

Renegade can now be played how i always wished, no more 5 fps to deal with lol. Im hoping this will help my rank get better and kill ratio.

Overall, mine's about the same, though I still get low FPS with many players present. And why do people play on those massive servers??? they usually run the official maps, all of which are too small and not designed for more than 32....as is Renegade itself, hell, I don't think any computer is recommended to be networked with more than that amount at any time.

whoops didn't read carefully [/edit]

BTW AMD is better than Intel even though the working frequency is lower than that of the same from Intel at compairable preformance.

whats fps mean?

I got on my computer:
Pentium 3 proccesser 935mhz
Geforce Fx 5500

I got a pretty shitty computer huh?

wassup csskiller , long time no see

To answer you question FPS means frames per second so the more there are the faster your comp is going.

kinghigh1 wrote on Mon, 13 June 2005 22:04my fps is between 12-36, is that slow if so how do I speed it up?

My average FPS was always 60 to 120. Meaning, it changed a lot depending on what was happening.

lol bigger servers are more fun, it's faster paced and more hectic. Ren's maps are really quite big, I think most of them could handle 50 people fine.

They only lag if the server is shite or if your comp is ancient. An Athlon XP 2500+ and an R9800 sell for not much at all, and that will run ren fine.

Asus A7n8x-E Deluxe

+

Point of View GeForce 6800 GT

+

1024 ddr ram

+

=

Still no game that I can't run. I mean all games can be run at high details with this.

My computer screen doesn't allow more than 60 as fps for renegade. Anyway it can go to 210 for fps. And it's around 80 in-game. I just don't remember what I need to change on video settings to enable fps count above 60... I did it once but can't remember... Or maybe I am just too lazy...

turn off vsync in your graphics card properties.

and also read this if you can be bothered - <http://www.d-silence.com/feature.php?id=255>

my comp as of this past february
Operating System: Windows XP Professional (5.1, Build 2600) Service Pack 2
(2600.xpsp_sp2_gdr.050301-1519)
Language: English (Regional Setting: English)
System Manufacturer: NVIDIA
System Model: AWRDACPI
BIOS: Phoenix - AwardBIOS v6.00PG
Processor: AMD Athlon(tm) 64 Processor 3500+, MMX, 3DNow, ~2.2GHz
Memory: 1024MB RAM
Page File: 494MB used, 1966MB available
Windows Dir: I:\WINDOWS
DirectX Version: DirectX 9.0c
Card name: NVIDIA GeForce 6800 GT -=[DHzer0point]=-
Manufacturer: NVIDIA
Chip type: GeForce 6800 GT
And Renadrin, turn off the VSync and possibly get a 3rd party driver. I get like 400-500 FPS in-game menu! Even though its like impossible!

DJM's SignatureDave's list of suck:...Iron Maiden...
Fuck you, man. Iron Maiden rocks.
I normally get about 24-35 FPS with my XP. Its a Microsoft Video Card, but it runs Battlefield: Vietnam, so its atleast equivalent to an ATI 8600. Im not really sure of everything else. I know its an Intel E-Machine. Oh, wait, i found something. Ill just list it all, and let yall figure it out.
330 Intel Celeron D Processor 330
2.66 GHz 256k L2 Cache 533 MHz FSB
80 GB Hard Drive(HA!)
Unimportant...
Intel Extreme Graphics 3D
Unimportant...
Unimportant...
Unimportant...
256 MB DDR SDRAM
Unimportant...
There.
I also always get the latest DirectX(9.0c)

Not bad, but your using a Onboard graphics card now.

I'd suggest you save up for a ATI Radeon. And be able to play alot of games on like 60 fps.

For Renegade a system like this is nice though. But the onboard graphics eat your memmory aswell.

Stop with the flaming, and I have a question for anyone who knows a lot about your gfx card config. I still get like 40-60 fps ingame even though I have a 6800 GT, is it because my resolution is so high or because I have something else configured wrong. VSync is off too. My settings are maxed out on ren too. Any thoughts or ideas are appreciated!

Yeah, thats what i had when i first played Ren. It was a 7000, but it was still capable of playing it on the lowest settings. If i could, i would loot the 9800 Pro out of my moms PC, but she wont let me because she thinks she needs it to play Solitaire.
