---

I am trying to set up a dual monitor configuration with my ATi X700 with two CRT monitors. However, once I plug the second monitor into the card, the primary monitor begins flicking on and off.

I have tried switching the two monitors just to see what would happen. So far, the second monitor (now as the primary monitor) went black for about a second, and returned to the display several times. Is there some sort of setting that I should have set, but haven't? Help is appreciated.

[edit] For a while the first monitor (now secondary) didn't work. All of a sudden, it turns on, but has a yellow tint.

Nevermind. The problem seems to have resolved itself. Crazy technology.
