I plan on attempting to host a game on my brother's server, but I'm bor sure if it will run on a Linux server. I thought C&C games were Windows games. But I see that RG has a Linux patch. Is it possible?

Linux servers can only host Renegade on gamespy up to now. Blazer is trying to solve this though.

Ah... Exactly, what is GameSpy? I hear you have to Pay-To-Play there? So how would I go about setting up a game there?

www.gamespyarcade.com (I think). It's just a different way of connecting to ren. It's also free.

Oh and if you want to join the row of 100 empty servers, be my guest but quite frankly: we don't need even more servers :-S.
