Subject: can macrem support the /ip=xx.xx.xx.xx option to the LFDS?

I have a linux box with multi ip address.
If I don't pass the /ip option to the renegade_server_1037b_rh7-3, it bind to the eth0 IP.
the solution is
./renegade_server_1037b_rh7-3 /ip=xx.xx.xx.xx
but when I try to run macrem (renegade_server) with the /ip option...
./renegade_server /ip=xx.xx.xx.xx
it doesn't work, may mac release version 0.4 to fix this?

Thanks,
howang

mac wrote on Fri, 25 August 2006 14:57I don't support that anymore, you'll have to do it yourself
and/or request the source code from BHS.
mac, if you have no time to deal with this, may you please release the source code so that I can
mod for it?
Thank you!

The wrapper is a perl application, rename the file to add the .zip extension and open it.

Well, Mac has not been around for over a year now. I doubt he will ever work on things like that
again. About your problem, is macrem an actual stand alone program? I know multiple ip's also
was a problem with BrenBot (renguard) but I fixed that some time ago.

Thanks man I've done the little modify and it works fine for me now.
