Is there a console command which will tell you which map number the FDS server is currently on?

An example: If CnC_Field comes in the rotation twice, as mapname02 and mapname08, it's impossible to tell which number its running if it's on CnC_Field. If you could send a command to the fds (EG mapnumber) which would then say something like 'I am currently on map number 08' you would know where it's up to in the rotation.

thanks

I knew it would be something really simple
