Subject: [webdev]HTML area for firefox?

Up to today I have been using a rather old (but fully satisfying) version of htmlarea as a WYSWYG - editor, however it doesn't work in Firefox.

I wondered if there are any of them out there that do work in firefox or if there would be any fixed version of htmlarea for it (would be even better).

According to the htmlarea website it works in firefox... perhaps you need a new version?

Quote:KTML for PHP :: Retired Product
Following the acquisition of InterAKT by Adobe, this product has been discontinued and will no longer be updated or available for sale.
So any help is still very welcome!
