So I started working on a little map, Did what this tutorial told me to do.. Map was looking sweet in RenX, Then.. I exported it..

I used some Alpha blending for the Sand trail and used a tutorial on making the water animated.. And Then it messed up..

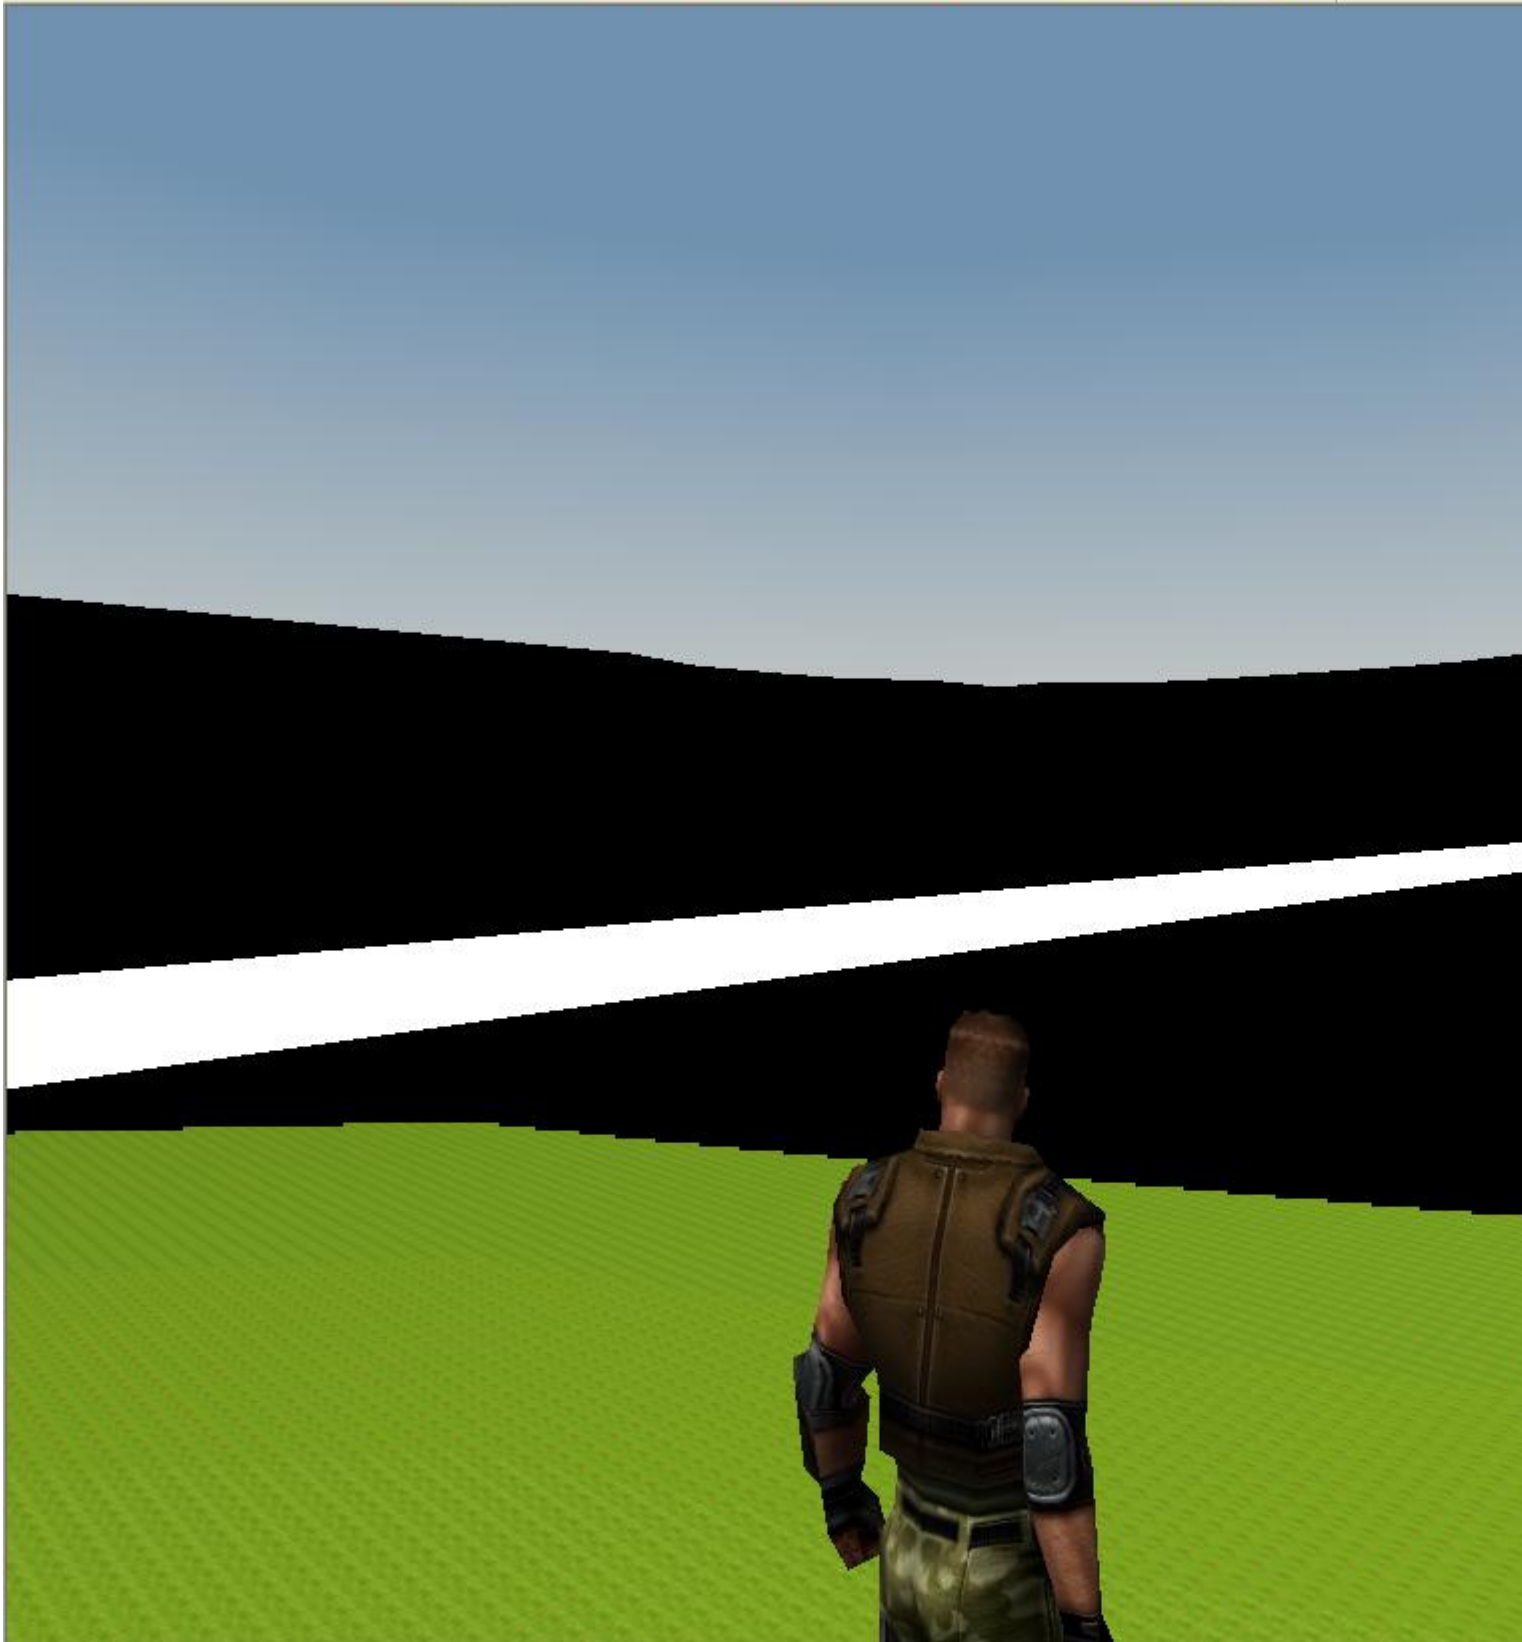

Also the grass looks way to small.. :/

What did I do wrong Here?

If you need more info on the settings I used in RenX, I'll tell you!

In RenX use UVW map and change the number of tiles for the grass.

Will that make the black surrounding me go away too?

Compute Vertex Solve with occlusion and it should work.

Looks like you're not actually touching the ground. Make sure the lowest point of the map is at 0,0,0 in renx.

The blackness stuff i think it because you displayed pass 2 instead of pass 1 on the alpha blend. 'Display' pass 1.

For texture issue, decrease uvw tiling or increase the size of the mapping.

I already fixed it.. I reduced the black-ness, But the grass looks huge, Tho that could just be the settings I used in the UVW settings.

Oh, I also got the water moving. :yay:

Just my sand trail didn't show.. I guess I have to remake the map. :<

The reason why you ever saw the blackness is because in the W3d options you never selected VAlpha within the collision settings. Once you do that anything which has alpha blending will actually show up...

For UVW mapping i suggest you always wtick with a certain number for the entire map unles you have things in the background which you dont plan on beeing visible at close range. Best to use Uvw settings of 8x8x8 or 5x5x5, otherwise for stuff further away use 10- 50 sqaure.
