i can't get brenbot 1.50 build 2 working
it's disconnecting from renguard
it's using 100 pct cpu time
it's not generating gamespy queries
and renegade.fds is at 1 fps
im at a loss, what is going on

Which plugins have you installed, and are you using the windows or linux version. Also does the problem exist with build 1?

no plugins, windows32 version, and it does happen in brenbot 1,50 build 1 aswell.

Its most likely due to the fact that constantly reconnecting to RG is leaving some sessions open that are busy trying to send data to the RG master server. Either your IP has been banned from the RG network or your firewall is blocking it.

I made a mistake in server.ini
Port = instead of Port = 0
GameSpyGamePort = instead GameSpyGamePort = 0
GameSpyQueryPort = instead GameSpyQueryPort = 0

But i still can't get the gamespy queries working:
my settings are:

in brenbot.cfg:
Generate_Gamespy_Queries = 1
GameSpyQueryPort = 25300
Broadcast_Server_To_Gamespy = 1
GameSpy_IP = 77.249.250.xx

in server.ini
[Server]
Config = svrcfg_cnc.ini
GameType = WOL
Nickname = JEEBEE78
Password = xxxxxxxx
Serial = xxxxxxxxxxxxxxxxxxxxxxxx
LoginServer = USA Server
Port = 0
GameSpyGamePort = 0
GameSpyQueryPort = 0
BandwidthUp = 0
NetUpdateRate = 10
AllowRemoteAdmin = true
RemoteAdminPassword = xxxxxxxx
RemoteAdminIP = 127.0.0.1
RemoteAdminPort = 4949

If both GameSpy and RenGuard can't connect properly it suggests your firewall is blocking them.

Renguard is no problem anymore but the the gsa queries don't work. I have opened port 4848 & 25300 on the router but i have tried using a direct connection on the modem and still no gsa queries so the ports shouldnt be a problem.

Did you open 25300 UDP or TCP? I think that port needs both TCP and UDP open IIRC.

For RenServer with GameSpy are needed only 2 ports.

4848 UDP for server.dat
25300/23500 UDP for GameSpy

the weird thing is
when i try
gamespy in server.ini no problem
normal queries in ase and server is accesable

when i try wol in server.ini no problem
server is accesable on wol

but when i try
wol + gamespy via brenbot 1.50
no queries in ase and server is accesable on wol but not on ase

BRenBot does not support ASE, only the default GSA client. I don't have the protocol for ASE and therefore cannot support it.

Use Renegade Ressurrection <http://www.icefinch.net/en>
And you will see your Server on WOL,GSA and ASE ^^

danpaul88 wrote on Fri, 13 July 2007 13:59 BRenBot does not support ASE, only the default GSA client. I don't have the protocol for ASE and therefore cannot support it.

I read in README - BRenBot 1.50.txt the following:
BRenBot 1.50 includes a GSA protocol system which improves on that in the current version of WOLSpy.

I don't see this as an improvement not being able to generate ase queries wheras wolspy 1.22 could. Moreover the normal Renegade fds is able to generate ase queries but not in wol mode.

For the ase protocol:
<http://www.int64.org/docs/gamestat-protocols/ase.html>

It improves on the GSA part of WOLSpy, as it uses the updated GSA protocol. That's why its called a GSA protocol system, and NOT an ASE protocol system.
