Open up Renegade Config and change it from 16 bit color to 32 bit color? Otherwise, I don't know what you mean unless you point out what's messed up.

AA and AF probably aren't too much of an option on that card without a sever performance hit (maybe 2xAF at best), but you may be able to bump the resolution (again, in Renegade Config) up to 1024x768. That will help a bit.

Well, anything above the minimum with a FX5200 sucks if you set it to 32 bit so >.>
