Any way to get a parameter string to retrieve a dns of a certain ip?  
It'd make life a lot easier.

I couldn't get \$dns to work... if retrieving a dns is what it's supposed to do.

BTW, don't tell me to try /help. I already tried it.

tried \$ip ?

Sometimes the most simplest of things work!

Go to the index and then search for \$dns; it explains how to use it and where. I don't exactly know if there's a way you could use it in the way you intend, though.

Quote:  
\$ip

Returns your IP address.

and for god sakes, read my post. I already used /help. I just can't get \$dns to work.

I tried \$dns(0).\*. \*.\*.\*, but that just say's "invalid parameter" on every action i try it on (/say, /msg, /notice, etc). Note that i didn't use the stars, but a actual ip.

I read your post. It clearly states in the help file how to use it.. :\\ Please actually read the help file if you're going to get mad over people telling you to read it. It is very easy to understand.

I'm not mad...

I was asking because \$dns didn't work, and if there was anything else.

There's a \$raddress, but that also can only be used on DNS.

You are talking about the programm mIRC in this topic I guess...

If you want to use this you need to know how to use mIRC Remote script events.

Everything about mIRC scripting is explained in its help file.  
Because mIRC first has to ask a DNS server, there is a delay,  
and therefore there is no identifier returning something,  
but an alias event getting called when the reply of the DNS server is received.

Quote: on DNS

The on DNS event triggers when a /dns query either succeeds or fails.

Format:        on <level>:DNS:<commands>

Example:        on 1:DNS:/notice \$me Resolved: \$raddress

## Examples

```
on 1:DNS:{  
var %n = $dns(0)  
echo 4 Found %n addresses  
while (%n > 0) {  
    echo 4 dns: $dns(%n) nick: $dns(%n).nick addr: $dns(%n).addr ip: $dns(%n).ip  
    dec %n  
}  
}
```

Note: This event is also triggered if you try to /dns a nickname, and the nickname is not on IRC.

### The \$dns(N) identifier

This identifier can be used only in the on DNS event, and returns the address that was resolved and any associated IP addresses.

Properties: nick, addr, ip

\$dns(N) without a property returns the address being resolved.

You can use N = 0 to return the number of addresses found.

You can use \$dns(0).nick/addr/ip to reference properties if an address couldn't be resolved.

Well, since I can't get a parameter string to retrieve a dns or anything,

I got another question... I can't get a simple command like this:  
/write -ils\$remove(\$strip(\$13),\$chr(41)) test.txt - \$3

to work. Is there any way to get a parameter string to work with a switch?

Nevermind. I figured it out.

Word \$+ Parameter = Quote:WordParameter

AmunRa wrote on Tue, 24 July 2007 20:13ever occur to you that irc scripting sucks? lolz

It does not ! It allows you to write useful scripts in a few secs  
Well, I wouldn't recommend it for bigger programmes...
