Hello Everyone.

I get this error come up on WOLSpy when it recieves the game\_info data from the FDS - maybe its trying to contact WOL when it does this..

Anyways, ive tried it on 2 PC's and both have the same problem

If you need me to post any setting files please let me know

Thanks

- 1) we need more info
  - 2) what bot do u run? both BR + NR have WOLSPY built right in nowadays
-

Hey there.

Im currently running these mods:

Modified Scripts.dll (by me)  
BlackIntel (Unsure of version)  
Biatch Anti Cheat

Also running Brenbot, but i have tried to start WOLSPY without brenbot running.

Is this the information you needed?

If not, please tell me exactly what you need - dont worry i aint a computer noob

\*edit\*

Just saw your edit, im trying your NR now, lets see what happens

ok well either way, i didnt think their was a need for WOLSPY these days lol.

Anyways, what exactly is the full error message that WOLSPY gives you i need the text after it rather than just the number.

---

its alot of text

Basically its trying to bind to a port thats inuse, and the error message is some long winded way of saying that lol

Does NR automatically login to WOL, or does the server need to be in WOL mode?

If you're using Brenbot 1.50 or higher then it has a WOLspy built into it. Look in your BrenBot.cfg and theres a setting right down the bottom called Broadcat server to GSA. Change the "0" to "1" put in the GSA query port. And restart the bot. BrenBot will now work like WOLspy and show GameSpy the server aswell as WOL.

Edit here's an example.

```
#-----  
# Gamespy Settings  
# Settings to control the Gamespy broadcaster. See the readme for more details.  
#-----  
  
# Enable the GSA broadcasting system  
Generate_Gamespy_Queries = 1  
  
# Query port for your server, which GSA uses to communicate with your server  
GameSpyQueryPort = 25308  
  
# Enable broadcasting to GSA, if disabled the server will not be listed on  
# the server lists. Also requires the gamespy_players module to be enabled.  
Broadcast_Server_To_Gamespy = 1
```

Yeah i thought that would work, but the problem is that when i stick my server in WOL mode, it says "Starting WOL Mode" and just bails out, creating a crash dump file...

Ive tried WOL mode on a clean server too, dont work.

Could you give me more info on the crash? Are your WOL settings correct?  
(Username/Password/Serial) Are the ports inuse?

Sure i can.  
I have attached the crash dump file.

Here is the FDS Output Log:

After it says about starting WOL mode, it just dies.

The username and password was given to me by my clan leader, he said it works but how would i go about checking this?

I'm not sure of any other information i can give you, if you know of anything else please ask me to give it to you.

Thanks for your time.

for NR you need to set Login Server: WOLSPY on the FDS Settings tab

re-install the FDS and make sure Shared Internet Components are enabled and that you select

WOL Mode upon install

Can you post your wolspy.ini from your WOLSPY Directory please?

Quote:Exception occurred at 0x004D2D1A .text:0x004D2D1A (server.exe)  
The Renegade FDS tried to write to address 0x000001c8 (No Owner)

server.exe????????? You either dont have a Renegade FDS or you are running some sort of mod.  
By default there is no server.exe in the FDS

Rename server.dat to server.exe and you have one.

on the FDS Settings tab  
re-install the FDS and make sure Shared Internet Componants are enabled and that you select  
WOL Mode upon install

I see now, i installed the FDS in "GameSpy" mode, i guess it didnt install extra components such  
as the WOL ones?

Anyways, when i try to install the FDS in WOL mode and enter details such as username,  
password etc etc, the Next button does not enable... - no idea why.

Can you post your wolspy.ini from your WOLSPY Directory please?

If i can get FDS working in WOL mode i wont need WOLSpy, so lets get this working first.

oh and p.s. i did rename server.dat to server.exe, cause that renegadeserver.exe autostart thing when the PC logs in is complete crap.

Imao

put your serial in as 066911111111111111111111111111111111 then it should let you install.  
Afterwards edit server.ini to put in your own serial.

Na ive just tried that...  
"069911111111111111111111"  
and "Next >" is still disabled, im starting to give up hope lol

Edit: Ignore this post rofl!...

Hi pals.

Im assuming that im screwed if im trying to setup a new WOL server now, cause the register page for making a new server username password and serail is dead...

ive tried making a username on WOL (just by logging in), which worked a treat, but seems the serails i use just dont wanna know...

Ive tried 4-5 fake serails (starting with 0669)  
Ive also tried 2 real serials (From the Client game)

I dont know what to do about this, but its just saying "Failed to create channel".

Ah well...

This topic can now be thrown away into the bliss...

WOL works fine now - Ty night
