Ok, so last night I restarted my computer to finish installing the new iTunes or whatever. When it turned back on, the screen was much smaller, as in it didn't fill the whole monitor. Then a little window pops up telling me that it just found the "video controller (VGA compatible)." It seems to think it's never been installed, and I have no disk to install it.

Either iTunes or something else you did between that restart and the last one before that messed up your video drivers. What video card do you have? Do you know? If you figure that out, drivers for almost any card can be downloaded, so you won't need any discs (which would probably have outdated drivers anyway).

My bro was having trouble with the new itunes as well. I Would suggest restoring back to before you installed the update and see if the problem persists.

Jamie

Yea, System Restore seems to be your best option. (Saved me SO MANY times)

My video card is a SiS 650_651_740. I went to the Sony website where they have an update and downloaded that, but I really don't want to use it if I don't have to.

I hope iTunes isn't the issue. But I'll try restoring and see if that works.

Well, 2 system restores didn't do the trick so I went and reinstalled. It seems to be working now.
Thanks all.
