Renegade worked perfectly until now. I recently reinstalled XP, since then I am unable to play the game. For the first time I successfully installed (after reinstalling xp), but I had a problem with the resolution (I forgot to install the video card drivers) so I reinstalled the game again. I read that sticky in how to "(Re)install Renegade in 9 steps". After the installation is finished I installed the patch and after that renguard and the core patches. When I open renegade I get an error message that says: "Unload the debugger and try again". And then renguard re-opens itself and the message shows up again.

I reinstalled Renegade like 10 times today and it really annoys me.

Please do post a screenshot of the error message.

No problem. I fixed it. It took me a few hours to do it. During that time my PC went through a system restore, virus scan (it got infected), installing drivers etc. So now I'm happy again! I think the Core Patch was installed wrong and it messed up Renegade and I deleted those stuff from the registry.

This could have been caused by viruses or programmes that are hooking into applications.
