If you aren't worried about losing the data on it...

Pitch it out and buy a new one.

im 16 i live with my mom and sister

my mom goes to school trys to work and takes care of my 6 year old niece my sister works but not enough......since rent gas and evcerything went up we cant even afforded a haircut for myself ...

Something like that happened to me. I bought my Dell Vostro 1500 about 4 months ago new. So after 4 months my HDD died and I had to get Dell to send me a new one. Man it was such a hassle for nothing.

A) If the data is not important proceed.

B) chkdsk /r x: (where x is your drive letter)
C) Try a regular format.
D) Low-Level Format (if you have no clue what or how, don't do this one)

From the sounds of it, 'chkdsk /r' and low-level format would be my options... (considering it's not important data on it)

What kind of hard drive is it? Is it a IDE or Sata? I can probably ship an extra HD to you.

If you're not worrired about losing data I would personally go with a low level format. Low level formats aren't recommended at all for anything however they can restore bad sectors on your HDD. You will PERMANENTLY loose all your data on there.

Tell me the drives make and model and i'll find you the proper LLF'er software for that drive.

Then you're pretty much fucked. You can't attempt to repair bad sectors without a LLF. You do realize this self destruction will only get worse over time. It would be wise to maybe backup your very important files/photo what have you onto DVD and format.

This is why I don't put any important documents on my older IDE drive. It's for all my random downloads and my My Documents, though that doesn't usually have anything important to me.

Old or new it doesn't matter a HDD can always fail.

Reminds me I have to resetup my DFS root...
I am not failproof now either

Since I decided to skipp on the Raid1 setup that I had .. I hope that it will last till I get holiday so I can reorganize & reinstall..

I have a few spare IDE and Sata HD's available if you need one of them.

Since you computer is old (I'm guessing), you can probably only put in a IDE hard drive, correct?

Speedy059 wrote on Wed, 02 July 2008 04:36Since you computer is old (I'm guessing), you can probably only put in a IDE hard drive, correct?

You can use SATA HD's on old computers.

You better stick with what you got. A USB will not connect a Sata hard drive to the Motherboard. If you motherboard is fairly old and only accept IDE connections then you will need an IDE hard drive.

"scandisk" used to do this in MS Dos, I'm sure Microsoft added a variant in Windows.

Looks like you have an error that can't be fixed by windows. There really isn't much else you can do to fix this. a LLF wont even guarantee a fix.

You need to absolutely backup your data and stop using that thing before you loose everything that's on it.

Yep...

Bad sectors usually can't be fixed... get a new HDD, then try to pump over as much of the data as possible. You can try Get-Data-Back or another type of disaster recovery to get stuff, that can't be seen by the Windows Explorer.
