Hey guy's i would like to know if this would be html or not but,

I would like to know away to find out if an anwser is correct or not.

So like i would ask in the html code, how to spell announced and you would have a place to give an anwser and when you click submit it will tell you if your right or wrong.

HTML for the form, javascript or one of many server-side languages to process the information on that form.

This isn't really a great place to ask buddy. If you spend some time Google'ing around you will find what you're looking for, but its going to take more than five minutes of your time. I also suggest visiting some web development forums.

PHP and html combo, name the file test.php:

```
if ($_SERVER['REQUEST_METHOD'] == 'POST'){
if ($_POST['name'] == "announced") {
echo "announced was spelled correctly";
}else{
echo "announced was not spelled correctly";
}
}else{
echo "<form method=POST action='test.php'>
<INPUT TYPE='hidden' NAME='submit' VALUE='lalalalala'>
How do you spell announced?
<BR>
<INPUT TYPE='text' NAME='name'>
<br><br>
<INPUT TYPE='submit' VALUE='Login'>
</form>";
}
```

Untested so might contain some typing errors.

<BR>
<INPUT TYPE='text' NAME='name'>
<br><br>
<INPUT TYPE='submit' VALUE='Login'>
</form>";
}
```

Untested so might contain some typing errors.
Could completely leave out the first line, it's kinda redundant since you're actually checking for the

$_POST variable in both the first and second lines.

If you're into Microsoft stuff, you could use Visual Web Developer Express to make these sort of web forms.

www.asp.net has all the tutorials you'll need for that.

Precisely why I suggested javascript first. *cough*

Mind you, the only reason I wrote the javascript like I did was for it to be easiest to understand while remaining fully functional.

```html
<html>
<head>
<title>Your page name</title>
<script type="text/javascript">
<!--
function proc_form(obj)
{
 var correct_spell = "correct_spelling_here";
 var word_entry = obj.the_word;
 if ( word_entry == "" )
 {
  alert("Please enter a word to spell.");
 }
 else
 {
  if ( word_entry.value == correct_spell )
  {
   alert("You have correctly spelled " + correct_spell);
  }
  else
  {
   alert("Please try again.");
  }
 }
 return false;
}
-->
</script>
</head>
<body>
<form onsubmit="javascript:return proc_form(this);">
```

```
 <input type="text" name="the_word" />
 <input type="submit" value="Check Spelling" />
</form>
</body>
</html>
```

You have to put <?php at the start and ?> at the end to activate PHP mode on the file. Also make sure the file has a .php extension.

  {
   alert("You have correctly spelled " + correct_spell);
  }
  else
```

```
  {
   alert("Please try again.");
  }
 }
 return false;
}
-->
</script>
</head>
<body>
<form onsubmit="javascript:return proc_form(this);">
 <input type="text" name="the_word" />
 <input type="submit" value="Check Spelling" />
</form>
</body>
</html>
```

where would i put the word that i want them to spell?

I tried putting it place's but failed.

Nice code tho it work's but it keeps saying pleas try again.

That's because you're running the script locally, one of many annoyances that leads to IE's
downfall IMO.
At least for testing at file:///

Your code is case sensitive

("announced" doesn't work, but "Announced" does)

Subject: Re: HTML

View Forum Message <> Reply to Message

Updated the script to remove case sensitivity because I was bored and just because I can:

```html
<html>
<head>
<title>Your page name</title>
<script type="text/javascript">
<!--
function proc_form(obj)
{
 var correct_spell = "correct_spelling_here";
 var entered_word = obj.the_word.value.toLowerCase();
 if ( entered_word == "" )
 {
  alert("Please enter a word to spell.");
 }
 else
 {
  if ( entered_word == correct_spell )
  {
   alert("You have correctly spelled " + correct_spell + "!");
  }
  else
  {
   alert("Please try again.");
  }
 }
 return false;
}
-->
</script>
</head>
<body>
<form onSubmit="javascript:return proc_form(this);">
 <input type="text" name="the_word" />
 <input type="submit" value="Check Spelling" />
</form>
</body>
</html>
```

Should just have to copy/paste, then edit a bit. There's no "installation" of code, just updating/changing.
I don't know any reason why you'd be getting the "Please try again." response unless you forgot to update the correct_spell variable.

Okay, here's what you do:
Copy my code, open your document, then press these key combinations in this exact sequence:

Ctrl+A
Ctrl+V
Ctrl+S

And then update the word to check against.

Microsoft Word itself can save as web pages (aka HTML documents).

For Office 2007: File [top-left round button] -> Save As -> Other Formats -> Save as Type: Web Page
For Office 2003: if I recall correctly, it's practically right in the File menu. (though I haven't used Office 2k3 in a LONG time, so I may be wrong)

Anybody knows that! But to actually send it as an email by using the code itself is my question because it generates a bad code.
