Unload all those annoying Logitech programs, and you should be fine, atleast that's what I do. But I have too, to get any kind of playable framerate.

westwood should make it so the holding secondary fire zooms the scope{unreal tournement} that way you can get the zoom fast for when there is someone you need to pick of in a real hurry before he reaches cover.

first, snipe the mutants in the cage, it's possible...Then shoot at her from accross the room, this will make the cinimatic start. First thing you do is run backwards when the cinimatic is over. Run down to the bottom and hide in the tunnel... They won't come down to ground level. The health regenerates at the other side of the room so use the volt riffle and hit and run tactics to kill her

I have your answer - if you don't ever use the "WebWheel," go into MSCONFIG (98 and XP) and remove the "EM_EXEC.EXE" check from your startup - if you're running 2K, run a search for EM_EXEC.EXE - the only match SHOULD be the key you have to delete. After that your mouse works like it should.

Wow.. thx so much if that actually works!! I've had the same problem with my logitec mouse this while time... but i've already complained about so many renegade bugs that I think they automatically delete every topic I start, so i figured it was a waste of time to post something as petty as this.

My mouse zooms, but when I scroll up it goes from no zoom to maximum zoom. No intermediate zooms.
