When I started modding Half Life 2, I was amazed at how easy it was to make maps. That is because you could make the terrain along with everything else in the map maker instead of making a terrain model and then importing it. I can survive the old Renegade way. But there's just one problem: if you don't have RenX working, you can not make maps. If you could make it so terrain editing could be integrated into the map editor (or make a RenX replacement), then that would be great. I doubt you have the source code to LevelEdit, but if you did, that would be nice of you to do. Thank you.

Even if we had the source code, it wouldn't be possible. HL2 maps are stored as bsp trees which map directly to their map editing software. Renegade has nothing even remotely similar.

But you can just hax0r it.

Just Kidding!

Gee, I wish it weren't so hard to make stuff work on my computer... Know any other ways to make terrain to import into Renegade?

you could just expand on hightfield tools tools if you had the source.

we can always rip off their maps and claim it's our own j/k but i think crossfire (i think hl2 has it too) would be hell of a fun time!

I've never used the heightfield stuff in my life, is it very useful, ever more useful then RenX (in any cases what so ever)?

Well i think it sucks but that is my opinion

I really can't work normally with heightfields

It suck ass, it just makes a plane and you can make hills and stuff and vertex paint and that's about it. Thats why it would be cool to expand it.

And also exactly why it can't be. It's stored as a heightfield, not a BSP tree or anything advanced enough to express "tunnels" or anything of that nature.

Is there any way that you could enable vis systems on heightfield maps? (Though I do think it is better to make your maps in Renx, mainly because you can have a vissystem)

Maybe if you extract it using XCC mixer, and if you have the proper plugins for loading w3d files?

madrackz wrote on Sun, 08 March 2009 07:37 Is there a way to load the Under.W3D in 3DS MAX without errors?

what do you mean by errors , like importer giving error or corrupting the meshes. I would use renx to import .w3ds , 3ds max w3d importer is just a rip off from renx.

madrackz i had the same issue, but do the following to make it work:

- import the map in RenX
- simply export the map again as .w3d the name doesn't matter
- import the map in 3DSMax.

That works for me

That reminds me of spawning map models inside the game, and stealthing it.

No.

LIES! Boot your map up in Renegade and use a DXRipper to pull your terrain out into a .3ds file, then import it into 3ds max and edit away. Export to .w3d and there you go!
