as said in a other post about my windows xp laptop i decided to start a new thread (srry) no one was reading my question in reply

my windows xp sp3 laptop has a wireless card, as i said I had to go to the dell website and download the wireless drivers..and out of all the drivers the only one that worked and made the device manager not show a ! was the inter(R) PRO/wireless LAN 2100 3A Mini Adapter

now the problem is it picks up all other network but cant find mine even with broadcasting on, i tried typing it in manual but when i type the password in (wpa2-psk 63 char long) and click ok i go back and only see about 6 or 7 \*\*\*\*\* instead of 63 \*\*\* (but even with that) it still cant detect my network and there 2 feet apart from my router

any ss or more info needed just ask

Are you sure the router is working? Are there other computers connected to/through that wireless connection?

With all of the tech questions you have, I'm wondering if you should even be allowed to touch any electronics, at all.

I do respect you being willing to ask for help, but answer this seriously: how long do you actually take to figure out problems on your own, including searching Google before coming on here and posting?

I wouldn't guess very long because it seems like every 20 minutes you're posting some tech question. If you DO take a considerable time, perhaps you just need to learn to utilize search engines better, or you're just one unlucky son of a bitch who always strikes out, but I can't imagine that's the case. There's too much information on the Internet for you to not be able to find an answer for a vast majority of your questions.
