Windows 7 Release Candidate is out!

<http://lifehacker.com/5240198/windows-7-rc-available-for-download-now>

While typing this I already have mine burnt to a disk, good luck to those who are downloading it

Yea it is supposed to work but it just hangs at random times and just doesn't go forth.

When it was downloading it went ~450 kb/ps which is good  
But i had to restart the DLM every time over and over so torrent was better and im downloading exactly the same one at the same speed so whatevrrrr

I am going to download it once I get home from work... wish it had been ready for downloading before I left this morning so I could have left it running. Oh well, it's only going in a VM anyway, can't wait for the RTM release so I can get my copy from MSDNAA and replace Vista.

I'm just annoyed that you cannot upgrade these to retail versions of Windows 7. I am more than likely going to have to reformat soon and it just seems like a waste of time installing XP again .

One small note: You CAN use this RC until June 2010

2 Questions:

1) You guys think I should install it on a VM or the empty space on my harddrive? (since I wanna be able to experience the speed difference and such)-

2) If I do install it on my pc empty space, how is the installing style once you put it in? by that do you get to choose where to install it, since I dont want to format my whole damn harddrive and install it over my vista and ubuntu partitions

Just make a 16GB partition, that's enough for Windows 7(32 bit, 64 bit requires at least 20GB)

I made 20, anyways does it give you an option to install on the empty space or a blank partition? (just want to be sure before I put it in the cd tray and restart my pc)

It gives you the option to pick a partition/drive to install it on.

That release was a pile of shit compared to the new RP2.

Anyway, I'm a little annoyed that I'll have to format to upgrade from the Windows 7 beta, but whatever. I'll do it eventually. The beta was great, but had a few problems that I hope are fixed in the RC.

Yeah, this is why I install it in a VM. I was hoping the RC would be upgradable to the final release so I could start using it as my main desktop OS, but unfortunately this is not the case, so I will stick with my VM for the time being. Once it goes RTM I will reformat and install it as my desktop OS.
