Does anyone have any knowledge whether or not Renegade works on Windows & Professional 64 bit?

Or any version of Win7 for that matter.

Thanks!

Windows 7 works fine with Renegade, if anything it works better than Vista did with Renegade.

For Windows 7 remember this: anything that works for Vista will work for Windows 7, Windows 7 is basically Vista but much much better.

And if something doesnt work on W7 you can get XP Mode for free

Then it surely will work again. (note that XP mode will take atleast 500mb of HD space)

Note: XP Mode is only available on Windows 7 Professional and above and you MUST have a processor that has hardware virtualisation support. Almost all AMD processors have this, while Intel processors are more hit and miss. You need to check if your processor supports Hyper-V (Intel) or AMD-V (AMD) to see if you will be able to run Windows XP mode.

Thanks for the replies guys.

I will be installing W7 Pro x64bit soon. I will post once I'm done with my results.

So the install went fine and for the record I followed the instructions in the sticked thread in this forum. BUT when I join some servers, e.g. n00bstories, Jelly I see nothing but yellow. My HUD shows up but nothing else does. Does anyone know what might be causing this or what to do to solve it?
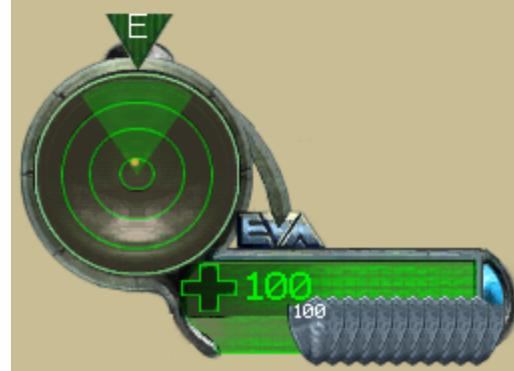

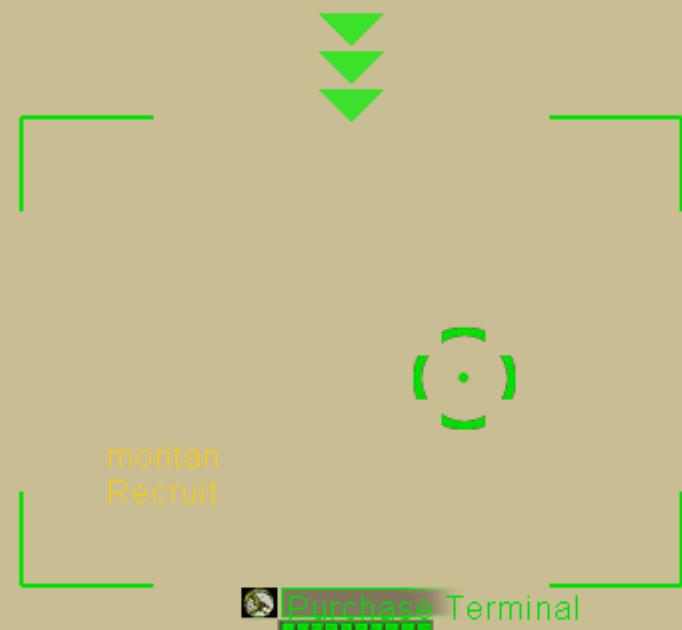

Thanks!

looks like a script problem, remove scripts and reinstall them:
-Delete scripts.dll
-Make a copy of scripts2 and rename the copy to scripts.dll
-put in the bhs.dll

if you don't have scripts just ignore this
