Ok, I got my old laptop working again, so I picked up where I left off. Thanks to Di3HardNL's more detailed tutorial I figured out how to get the boning part down.

When I have this in RenX the Locke stays with the bones in the animations, but when I export it and open Ren... I get this:

I tried unlinking the blue dots and relinking manually to the bones, and autolinking by smaller groups... but I keep getting the feet in the crotch in game?

Anyone seen this before or have any idea what I am doing wrong?

Like I said, it doesn't do this in RenX... only when exported and opened in Ren.

New problem SS

The problem before may have been because forgot to add the skeleton... but now when I add the skeleton (s\_a\_human) I get this crazy long arms, and the character walks sideways.

Any ideas?

Are you sure Locke uses the A skeleton? He might use one of the special variants...

I had only heard of the one for male (s\_a\_human) and one for female (s\_b\_human)... but now that I take a second look into my mixer I see 2 more s\_c\_human and s\_z\_human.

Anyone know more about what the others are for?

In the mean time I will try to export using the others including the female one just to see what happens.

Edit: lols, this what happen with s\_z\_human

wtf

fagmax is gay...

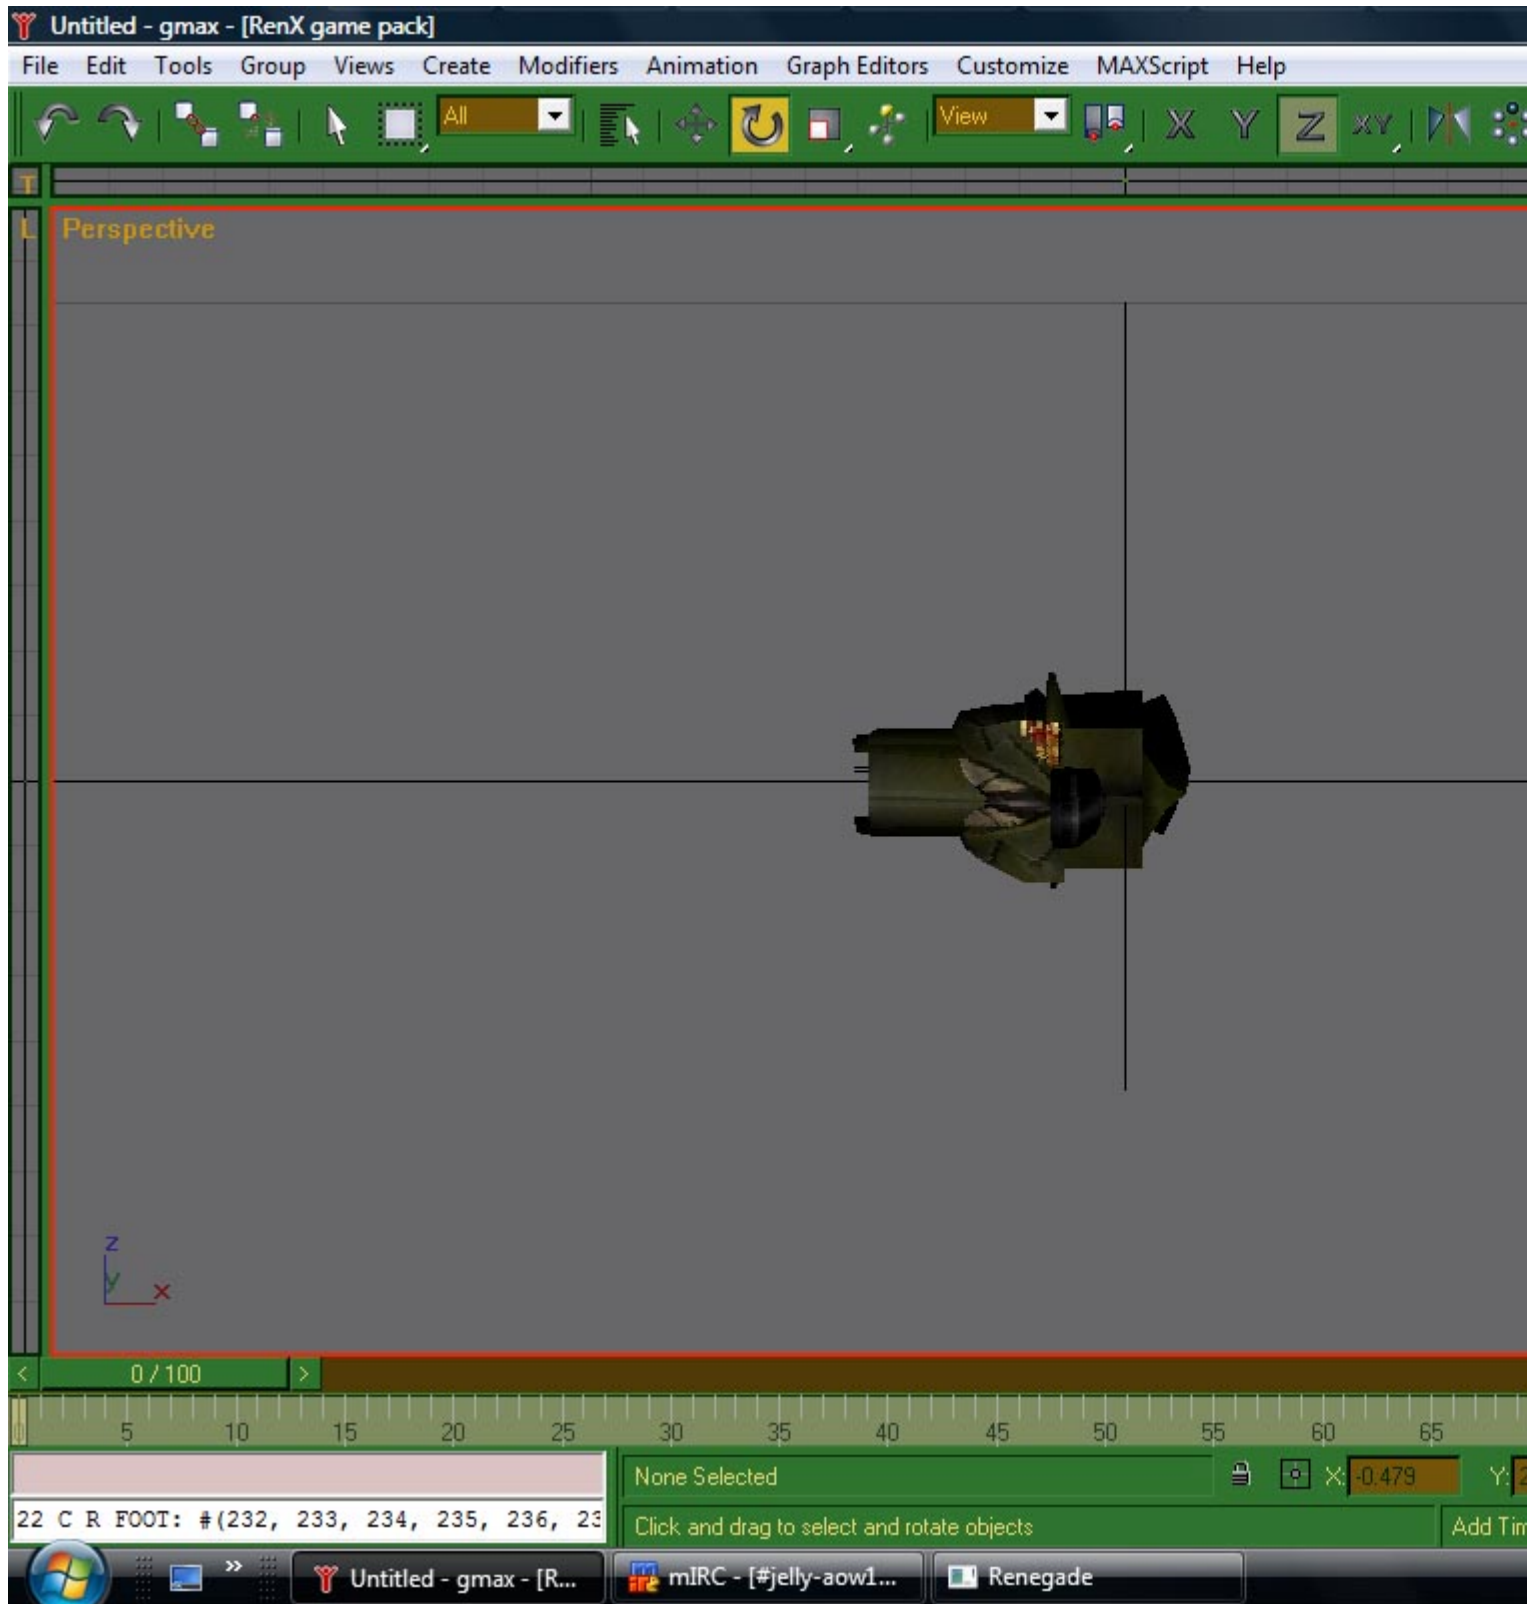

Now when I open c\_gdi\_locke\_l0 I get this clump of crap...

Is it corrupt? Could that be causing all this crap?

No, it means you haven't imported a skeleton...

The s\_c\_human is for mutants.

I'm unaware where the s\_z\_human is for.

So the best looking thing I have come out with is exporting without skeleton...

In the same file with the gmax scene there is another file H\_A\_A0A1, does anyone know what it's purpose is?

Also this may sound like a dumb question... When you import the w3d shouldn't you use the same skeleton as the one you intend to export with?

Figured out my problem... Nobody ever said how important it was to rotate the scene back so it

---

faces the right before you export... lols

Nobody expected you to have rotated it after importing it I suppose... why not rotate the view instead of the model?

What modelling program are you using? In both RenX and 3DS Max theres a button at the bottom somewhere that looks like a sort of pie chart thing, if you select that and then click anywhere in the view you can drag your mouse around to rotate your view around.

I found what you are talking about. I just never looked for anything else because I was affraid if I started messing with ohter buttons I would screw something up.

Like when I first started using the program, I would go to rotate/move the scene and it would show all 3 axis, but now I have to click the squares up top to select the axis one by one... I think the cat did it when he walked across my laptop.
