how does renlist work? like i want to make a desktop addon for rainmeter that allows me to join/view how many players are in game of a certain server

if you don't know what rainmeter is google it ( [www.rainmeter.net](http://www.rainmeter.net) ) idk if we are allowed to post links here, if we arn't i apologize

thanks to anyone who can comment

I do not know what renlist is, but if it displays servers on WOL and their player counts, it most likely (or infact postively must) join XWIS and then does a LIST command. Whatever is returned, it then must break it down for the user to make sense of.
