I no longer play renegade and have decided that it's time to share my source for my bot OnOeS, this includes the full source and php

Credits for the coding goes to myself, jnz and pvtorschlag

You can download it [here](#)

Any questions or help needed should be directed to me on irc.jelly-server.com, channels #jelly or #st0rm

If you add any std:: to OnOeS, it's programmed to reformat your computer and send your address to Hex, who will in turn pay you a visit and ensure you have a slow and painful death.

just sayin'

How did the database quires hold up without threading? Lagged the server, or didn't even notice?

Caused no lag what so ever that I noticed (over a couple of years) FPS were always good never really dropping below 58, a lot of lag issues due to things like queries were fixed within weeks of finding them

I don't play anymore either but look forward to going through the source code. It's always nice to check out things like this that are both above my skill level and relevant to my interests

I'm curious, why would it lag the server if the SQL library isn't multi-threaded? I'm not that familiar with database engines but I have never heard of that. It would be kinda weird because SQLite is designed to be usable in embedded systems and it supports in-memory databases. SSGM 2.0.2 gest a file handle for reading, writes a message to that file, then closes it every single time the WriteGamelog() function is called, which happens every two seconds for every player plus for most game events.

It's blocking.

The next code to execute will not do so until the SQL query has completed it's function.

If it all runs quickly then you wont notice. I imagine (but can't be sure) that a small DB and small table on a fast server would not cause any more lag than other I/O disk operations (such as reading from a text file, or writing to it).

However, to make it non-blocking, you could work with threads.

Yes, at home, but I'm almost positive its written for SSGM 2.0.2, in which case it would require a substantial amount of work to bring it up to speed. There's also pretty much zero documentation and comments so its nearly a lost cause (aside from informational purposes).

Iran ported some of the features to 4.0 - it's called AzazelBot on his list of releases (
[http://www.renegadeforums.com/index.php?t=msg&th=39663&start=0&rid=2 5967](http://www.renegadeforums.com/index.php?t=msg&th=39663&start=0&rid=25967))

That may be a better place to start if you want to want to modify it yourself; if you merge several of his plugins together then you'll have recreated a large portion of OnOeS anyway.

Anyone got a mirror for this? I lost it and the download link doesn't work.

EDIT: ExEric3 sent it to me. I've attached it..
