In the old scripts there was this function :

```
bool isin(string String,string Search) {  
    if (String.find(Search) != std::string::npos) return true;  
    return false;  
}
```

however in the new 4.0 im not supposed to use the std classes but i dont understand anything of the new string classes and cant find any information about it.

any help would be appreciated.

Try using strstr on the raw character arrays

<http://www.cplusplus.com/reference/cstring/strstr/>

thnx that worked but how do i define a string or vector.
because ive notice chatcommandclass is gone and im stil searching for a replacement in new scripts.
