I was flying an Apache when suddenly I crashed!

It was a horrible crash: Smoke started coming out of my PSU, my keyboard stated sparking, my TV started changing channels all on its own, my lights began to flicker all over the house, and there was an odd green glow coming from outside my window!

You guys need to fix that.

We are seeing some strange things in this crashdump that suggest that something is hooking Direct3D in a strange way for some reason. Could be indicative of a cheat or hack, could be indicative of a virus or it might be hardware failure.

In any case there is nothing in this dump we can do anything about.

I'm thinking it's more likely the latter. I've run multiple scans an have found no viruses plus the only thing I have in my data folder besides maps is ack's custom dazzle.ini.

I do have a new mobo, ram, and cpu which I've been putting off installing. I guess I should stop putting it off.
